Nature's Recycling

is a simple way to reuse plant waste. Composting breaks down plant materials into minerals and returns them to the soil. Adding composted soil to a garden helps to grow them to good use in a compost pile. Composting is nature's recycling method. Did you know that dead leaves, grass clippings, and fruit and vegetable peels are landfills. cities compost on a large scale in order to stop organic materials from taking up space in stronger, healthier plants. Composting keeps plant waste out of trash dumps. valuable natural resources? Rather than throw these things in the trash, we can put Some

them do the job. Choose an inconspicuous spot in your yard. Place a wood or wire bin Making your own compost is easy. You gather "food" for bacteria and fungi, then let there. It doesn't need a lid. That way, when it rains, the pile will get wet. Water helps a general rule, you can add any brown or green plant matter. Although you can put in eggshells, never add animal droppings, cheese, or pieces of meat or fat. These things potato peelsthe materials to decay. Throw kitchen scrapstake a long time to break down and may attract wild animals. into the pile. When you cut your grass, add the clippings to the pile. As -things like tea bags, orange rinds, and

you can recycle those minerals again! dioxide, calcium, phosphorus, and many other minerals. Spread the humus on your garden, and watch your plants grow. After they die, add them to the compost pile. Then smaller and will look like soil. This material is called humus. materials cannot live without enough air. After just one year the compost pile will be way the rotting materials get more air. Many of the bacteria and fungi that break down About twice a month, you must turn the pile by digging it up a bit with a shovel. This Spread the humus on your Humus contains carbon
